CFB400W Series

Application Note V15 October 2015

1. Introduction

This specification describes the features and functions of Cincon's CFB400W series of isolated DC-DC Converters. These are highly efficient, reliable and compact, high power density, single output DC/DC converters. The modules can be used in the field of telecommunications, data communications, wireless communications, servers, base station, etc. The CFB400W series can deliver up to 80A output current and provide a precisely regulated output voltage over a wide range of 9-36 and 18-75VDC. The modules can achieve high efficiency up to 90%. The module offers direct cooling of dissipative components for excellent thermal performance. Standard features include isolated remote on/off (positive or negative), remote sense, output voltage adjustment, over voltage, over current and over temperature protection. Parallel operation is also optional.

2. DC-DC Converter Features

- 400W Isolated Output
- Efficiency (at full load) up to 90%
- Regulated Output
- Fixed Switching Frequency
- Input Under/Over Voltage Lockout Protection
- Over Current Protection
- Isolated remote On/Off
- Continuous Short Circuit Protection
- Industry Standard Full-Brick Package
- Fully Isolated to 1500VDC

4. Technical Specifications

(All specifications are typical at nominal input, full load at 25°C unless otherwise noted.)

ABSOLUTE MAXIMUM RATINGS

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

CFB400W Series

Application Note V15 October 2015

5. Main Features and Functions

5.1 Operating Temperature Range

The CFB400W series converters can be operated within a wide case temperature range of -40°C to 100°C . Consideration must be given to the de-rating curves when ascertaining maximum power that can be drawn from the converter. The maximum power drawn from full brick models is influenced by usual factors, such as:

- Input voltage range
- Output load current
- Forced air or natural convection

5.2 Output Voltage Adjustment

Section 6.8 describes in detail how to trim the output voltage with respect to its set point. The output voltage on all models is adjustable within the range of 80% to 110%.

5.3 Over Current Protection

The converter is protected against over current or short circuit conditions. At the instance of current-limit inception, the module enters a constant current mode of operation. While the fault condition exists, the module will remain in this constant current mode, and can remain in this mode until the fault is cleared. The unit operates normally once the output current is reduced back into its specified range.

5.4 Output Overvoltage Protection

The converter is protected against output over voltage conditions. When the output voltage is higher than the specified range, the module enters a hiccup mode of operation.

5.5 Remote On/Off

The on/off input pins permit the user to turn the power module on or off via a system signal from the primary side or the secondary side. All models are available in "negative logic" (standard) and "positive logic" (optional) versions. Negative logic turns the module on as long as a current (1-10mA) is flowing between +on/off and -on/off and inactive when no current is flowing (floating). Models with part number suffix "P" are the "positive logic" remote on/off version. Positive logic turns the module off as long as a current (1-10mA) is flowing between +on/off and -on/off and active when no current is flowing (floating), the module will turn on.

5.6 UVLO&OVLO (Under/Over voltage Lock Out)

Input under/over voltage lockout is standard with this converter. At input voltages below/beyond the input under voltage lockout limit, the module operation is disabled.

5.7 Over Temperature Protection

These modules have an over temperature protection circuit to safeguard against thermal damage. When the case temperature rises above over temperature shutdown threshold, the converter will shut down to protect it from overheating. The module will automatically restart after it cools down.

6. Applications

6.1 Recommended Layout, PCB Footprint and Soldering Information

The system designer or end user must ensure that metal and other components in the vicinity of the converter meet the spacing requirements for which the system is approved. Low resistance and inductance PCB layout traces are the norm and should be used where possible. Due consideration must also be given to proper low impedance tracks between power module, input and output grounds. The recommended soldering profile and PCB layout are shown below.

Lead Free Wave Soldering Profile

Note :

1. Soldering Materials: Sn/Cu/Ni
2. Ramp up rate during preheat: $1.4^{\circ}\text{C}/\text{Sec}$ (From 50°C to 100°C)
3. Soaking temperature: $0.5^{\circ}\text{C}/\text{Sec}$ (From 100°C to 130°C), 60 ± 20 seconds
4. Peak temperature: 260°C , above 250°C 3~6 Seconds
5. Ramp up rate during cooling: $-10.0^{\circ}\text{C}/\text{Sec}$ (From 260°C to 150°C)

Recommend PCB Pad layout

CFB400W Series

Application Note V15 October 2015

6.2 Convection Requirements for Cooling

To predict the approximate cooling needed for the full brick module, refer to the power de-rating curves in section 6.4. These de-rating curves are approximations of the ambient temperatures and airflows required to keep the power module temperature below its maximum rating. Once the module is assembled in the actual system, the module's temperature should be monitored to ensure it does not exceed 100°C as being measured at the

center of the top of the case (thus verifying proper cooling).

6.3 Thermal Considerations

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. The test data is presented in section 6.4. The power output of the module should not be allowed to exceed rated power ($V_{o_set} \times I_{o_max}$).

CFB400W Series

Application Note V15 October 2015

6.4 Power De-rating

The operating case temperature range of CFB400W series is -40°C to $+100^{\circ}\text{C}$. When operating the CFB400W series, proper de-rating or cooling is needed. The maximum case temperature under any operating condition should not be exceeded 100°C .

The following curve is the de-rating curve of CFB400W series without heat sink.

Example:

What is the minimum airflow necessary for a CFB400W-48S24 operating at nominal line, an output current of 16.7A, and a maximum ambient temperature of 40°C

Solution:

Given: $V_{in}=48V_{dc}$, $V_o=24V_{dc}$, $I_o=16.7A$

Determine Power dissipation (P_d):

$$P_d = P_i - P_o = P_o(1-\eta)/\eta$$

$$P_d = 24 \times 16.7 \times (1-0.9)/0.9 = 44.5 \text{ Watts}$$

Determine airflow:

$$\text{Given: } P_d = 44.5 \text{ W and } T_a = 40^{\circ}\text{C}$$

Check above Power de-rating curve:

minimum airflow= 700 ft./min.

Verifying: The maximum temperature rise $\Delta T = P_d \times$

$$R_{ca} = 44.5 \times 1.23 = 54.7^{\circ}\text{C}$$

$$\text{The maximum case temperature } T_c = T_a + \Delta T = 94.7^{\circ}\text{C} < 100^{\circ}\text{C}$$

Where: The R_{ca} is thermal resistance from case to ambience.

The T_a is ambient temperature and the T_c is case temperature.

Chart of Thermal Resistance vs Air Flow

AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection	
20ft./min. (0.1m/s)	3.82°C/W
100 ft./min. (0.5m/s)	3.23°C/W
200 ft./min. (1.0m/s)	2.71°C/W
300 ft./min. (1.5m/s)	2.28°C/W
400 ft./min. (2.0m/s)	1.92°C/W
500 ft./min. (2.5m/s)	1.68°C/W
600 ft./min. (3.0m/s)	1.50°C/W
700 ft./min. (3.5m/s)	1.35°C/W
800 ft./min. (4.0m/s)	1.23°C/W

CFB400W Series

Application Note V15 October 2015

The following curve is the de-rating curve of CFB400W series with heat sink M-B012.

Forced Convection Power De-rating with Heat Sink M-B012

Example:

What is the minimum airflow necessary for a CFB400W-48S24 operating at nominal line, an output current of 16.7A, and a maximum ambient temperature of 40°C

Solution:

Given: $V_{in}=48V_{dc}$, $V_o=24V_{dc}$, $I_o=16.7A$

Determine Power dissipation (P_d):

$$P_d = P_i - P_o = P_o(1-\eta)/\eta$$

$$P_d = 24 \times 16.7 \times (1-0.9)/0.9 = 44.5 \text{ Watts (Chart of Thermal Resistance vs Air Flow)}$$

Determine airflow:

Given: $P_d=44.5W$ and $T_a=40^\circ C$

Check above Power de-rating curve:

minimum airflow= 200 ft./min.

Verifying: The maximum temperature rise $\Delta T = P_d \times R_{ca} = 44.5 \times 1.17 = 52.1^\circ C$

$$\text{The maximum case temperature } T_c = T_a + \Delta T = 92.1^\circ C < 100^\circ C$$

Where: The R_{ca} is thermal resistance from case to ambience.

The T_a is ambient temperature and the T_c is case temperature.

AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection 20ft./min. (0.1m/s)	2.4 $^\circ C/W$
100 ft./min. (0.5m/s)	1.76 $^\circ C/W$
200 ft./min. (1.0m/s)	1.17 $^\circ C/W$
300 ft./min. (1.5m/s)	1.00 $^\circ C/W$
400 ft./min. (2.0m/s)	0.83 $^\circ C/W$

6.6 Efficiency VS. Load

CFB400W Series Application Note V15 October 2015

CFB400W Series

Application Note V15 October 2015

6.7 Test Set-Up

The basic test set-up to measure parameters such as efficiency and load regulation is shown below. When testing the modules under any transient conditions please ensure that the transient response of the source is sufficient to power the equipment under test. We can calculate:

- Efficiency
- Load regulation and line regulation.

The value of efficiency is defined as:

$$\eta = \frac{V_o \times I_o}{V_{in} \times I_{in}} \times 100\%$$

Where:

V_o is output voltage,
 I_o is output current,
 V_{in} is input voltage,
 I_{in} is input current.

The value of load regulation is defined as:

$$\text{Load.reg} = \frac{V_{FL} - V_{NL}}{V_{NL}} \times 100\%$$

Where:

V_{FL} is the output voltage at full load
 V_{NL} is the output voltage at no load

The value of line regulation is defined as:

$$\text{Line.reg} = \frac{V_{HL} - V_{LL}}{V_{LL}} \times 100\%$$

Where: V_{HL} is the output voltage of maximum input voltage at full load. V_{LL} is the output voltage of minimum input voltage at full load.

CFB400W Series Test Setup

Recommend C1 and C2 Value

CFB400W-24SXX: C1:1000uF/50V
 CFB400W-48SXX: C1:330uF/100V

For CFB400W series it's necessary to connect the input electrolytic capacitor C1 with low ESR to prevent the effective of input line inductance to the DC/DC converter.

For stable operation, connect a low impedance electrolytic capacitor C2 in the output terminals according to output capacitance items in page 6.. When operated at lower temperature than -20 °C ,

increasing the C2 capacitance with three or four times more than the recommended value.

6.8 Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down according to the trim range specification (80% to 110% of nominal output). This is accomplished by connecting an external resistor between the +Vout and +Sense pin for trim up and between the TRIM and -Sense pin for trim down, see Figure

Output voltage trim circuit configuration

The Trim pin should be left open if trimming is not being used. The output voltage can be determined by the following equations:

$$V_f = \frac{1.24 \times \left(\frac{R_t \times 33}{R_t + 33} \right)}{7.68 + \frac{R_t \times 33}{R_t + 33}}$$

$$V_{out} = (V_o + V_R) \times V_f$$

Unit: KΩ

V_o : Nominal Output Voltage

Recommend R_t : 6.8KΩ

The output voltage can also be adjustment by using external DC voltage

$$\text{Output Voltage} = \text{TRIM Terminal Voltage} \times \text{Nominal Output Voltage}$$

Note: the output voltage can be increased by the remote sense and the trim. The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage

CFB400W Series

Application Note V15 October 2015

of the module can be increased and consequently increase the power output of the module if output current remains unchanged. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power = $V_{o, \text{set}} \times I_{o, \text{max}}$)
The output voltage on 5V&12V models is adjustable within the range of +10% to -20%. For 24V&28V&48V models, see input& output trim curves for trim up and trim down ranges.

CFB400W Series

6.9 Output Remote Sensing

The CFB400W SERIES converter has the capability to remotely sense both lines of its output. This feature moves the effective output voltage regulation point from the output of the unit to the point of connection of the remote sense pins. This feature automatically adjusts the real output voltage of the CFB400W series in order to compensate for voltage drops in distribution and maintain a regulated voltage at the point of load. The remote-sense voltage range is:

$$[(+V_{out}) - (-V_{out})] - [(+Sense) - (-Sense)] \leq 10\% \text{ of } V_{o_nominal}$$

If the remote sense feature is not to be used, the sense pins should be connected locally. The +Sense pin should be connected to the +Vout pin at the module and the -Sense pin should be connected to the -Vout pin at the module.

This is shown in the schematic below.

Note:

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased and consequently increase the power output of the module if output current remains unchanged. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power = $V_{o, set} \times I_{o, max}$)

6.10 Output Ripple and Noise

Output ripple and noise is measured with 1.0uF ceramic and 10uF solid tantalum capacitors across the output.

6.11 Output Capacitance

The CFB400W series converters provide unconditional stability with or without external capacitors. For good transient response, low ESR output capacitors should be located close to the point of load. PCB design emphasizes low resistance and inductance tracks in consideration of high current applications. Output capacitors with their associated ESR values have an impact on loop stability and bandwidth. The output capacitance is recommended in output capacitance items which need three or four times capacitance when operating below -20°C and the absolute maximum value of CFB400W series' output capacitance is 10000uF. For values larger than this, please contact your local CINCON's representative.

6.12 Parallel Operation

The CFB400W series (except 5Vout) are also designed for parallel operation. When paralleled, the load current can be equally shared between the modules by connecting the PC pins together.

There are two different parallel operations for CFB400W series, one is parallel operation when load can't be supplied by only one power unit; the other is the N+1 redundant operation which is high reliable for load of N units by using N+1 units.

(a) parallel operation (except 5Vout)

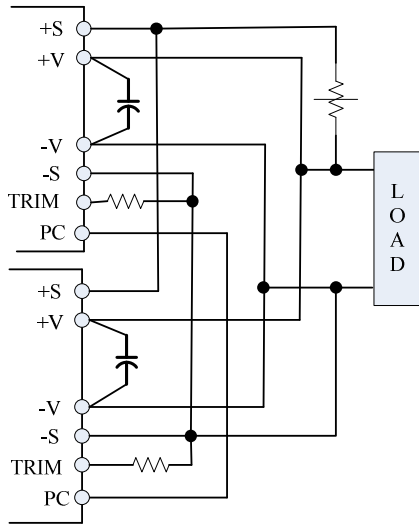

(b) Parallel operation with programmed and adjustable output (except 5Vout)

Application Note V15 October 2015

(c) N+1 redundant connection

(d) N+1 redundant connection with programmed output and adjustable output voltage

6.13 IOG signal

Normal and abnormal operation of the converter can be monitored by using the I.O.G signal. Output of this signal monitor is located at the secondary side and is

open collector output, you can use the signal by the internal aux power supply or the the external DC supply as the following figures. the ground reference is the $-sense$. For the sink current and voltage rating applied see output characteristic on page 6.

By internal AUX

By external DC supply

This signal is low when the converter is normally operating and high when the converter is disabled or when the converter is abnormally operating.

6.14 Auxiliary Power for output signal

The auxiliary power supply output is within 7-13V with maximum current of 20mA. Ground reference is the $-sense$ Pin.

6.15 On/Off Control

The converter's on/off can be controlled from the input side or the output side.

Output voltage turns on when current is made to through on/off terminals which can be reached by opening or closing the switches. The maximum current through the on/off pin is 10mA, setting the resistor value to avoid the maximum current through the ON/OFF pins.

(A) Controlling the on/off terminal from the input side, recommend R1 value is 12K (1.0W) for 48Vin and 6K (0.5W) for 24Vin.

(B) Controlling the on/off terminal from the output side, Recommend R2 value is 4.3K (0.1W).

7. Safety & EMC

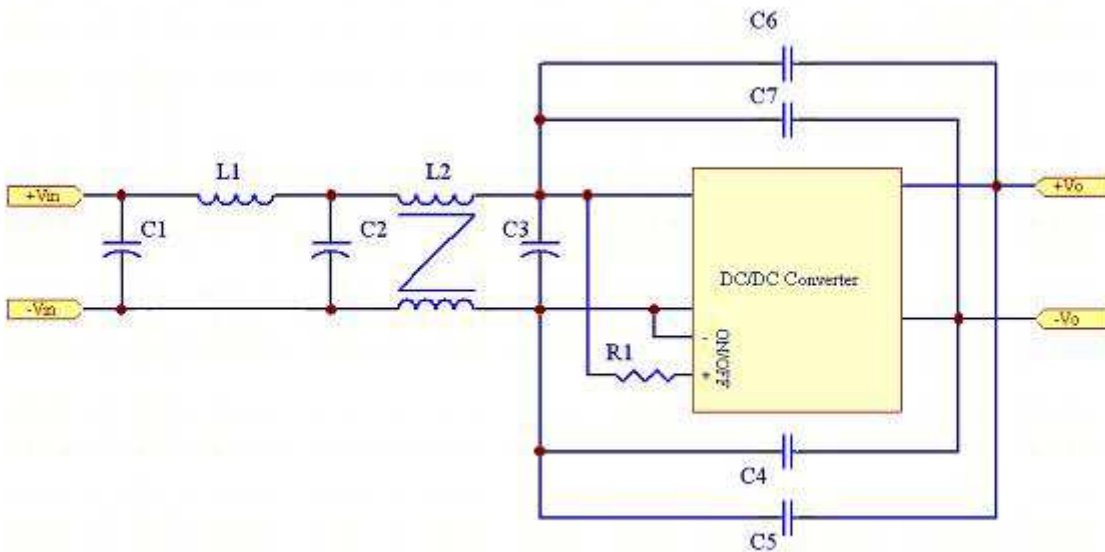

7.1 Input Fusing and Safety Considerations

The CFB400W series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 80A fast blow type fuse for 24V_{in} models, and 40A for 48V_{in} models. It is recommended that the circuit have a transient voltage suppressor diode (TVS) across the input terminal to protect the unit against surge or spike voltage and input reverse voltage (as shown).

7.2 EMC Considerations

Suggested Circuits for Conducted EMI CLASS A

(1) EMI and conducted noise meet EN55022 Class A specifications:

Model No.	C1	C2	C3	C4	C5	C6	C7	L1	L2	R1
CFB400W-24S12	NC	470uF/50V	1000uF/50V	2200pF/2KV	NC	NC	NC	Short	200uH RM8 SM100	9.1K
CFB400W-48S48	330uF/100V	330uF/100V	330uF/100V	NC	NC	NC	NC	1uH SPI-13050-1R0	1.5mH CM20*12*10	9.1K

Note: 470uF/50V, 1000uF/50V NIPPON CHEMI-CON KY series aluminum capacitors, 330uF/100V NIPPON CHEMI-CON KMF series aluminum capacitors and C4 ceramic capacitors.
